PASSENGER CARS

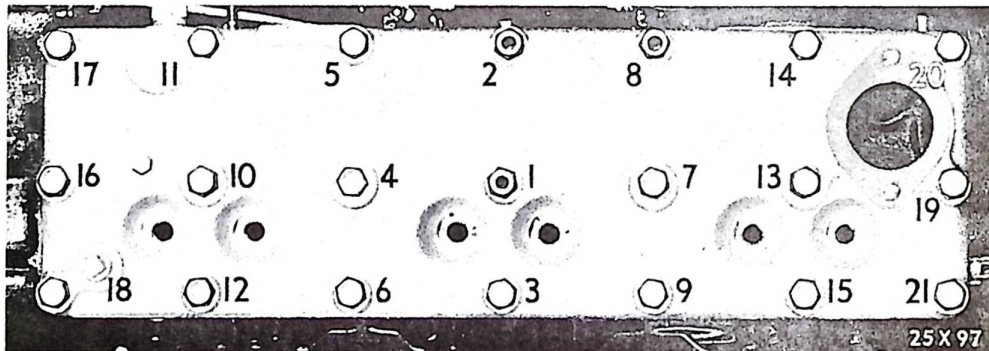

SERVICE DEPARTMENT
DODGE

DIVISION OF CHRYSLER CORPORATION

TO ALL DODGE DIRECT DEALERS AND DEALERS:

Due to the critical shortage of copper, steel cylinder head gaskets will be used from time to time, in place of the copper cylinder head gaskets.

It is extremely important that the cylinder head bolts be tightened in the sequence shown in the following illustration.

All bolts should be tightened with a torque wrench while the engine is hot, to the following:

65 - 70 lbs. feet.

Cylinder head bolts should never be tightened beyond the above figures, as the bolts may stretch, which will leave the cylinder head gasket loose and liable to leak. Should this happen, it is possible for the cylinder head gaskets to burn through, between the cylinders and etching of the cylinder block or head may result particularly when the steel cylinder head gasket is used.

Cylinder heads should be checked for tightness prior to delivery of the vehicle to the customer and at the 1000 and 3000 mile inspections.

SERVICE BULLETIN

SERVICE DEPARTMENT

DODGE

DIVISION OF CHRYSLER CORPORATION

TO ALL DODGE DIRECT DEALERS AND DEALERS:

Some time ago a number of "Fram" oil filters were used on Model D-33 and D-34 Dodge Cars. At the time that these oil filters were used, the Chrysler Motors Parts Corp. were unable to service the "Fram" gasket for use with a replacement filter package.

However, MoPar oil filter element package #1321287 is now available through the Parts Corporation which contains the correct gaskets and element for the Fram type oil filter.

The "Fram" filter entered production at Engine D34-78910 and ended at D34-85992.
